MNT Education Special Interest Group (MNT^eSIG Live) 2020 Virtual Conference Via Zoom, July 27-28, 2020
Online Visualization and Simulation Tools for Teaching Nanotechnology

Abstract

Visualization and Simulation enhance students' understanding of the material world at nanoscale. The purpose of presentation is to discuss the use of free online visualization and simulation tools for teaching Nanotechnology courses. Professors can use these online tools to enhance students learning of complex concepts at nanoscale without buying the expensive equipment. These tools include 26 RAIN (remote access instruments in nanotechnology) nodes for accessing visualization instruments and 500+ simulation tools at nanoHuB allowing students to simulate and understand nanotechnology concepts; and CompuCell3D, a flexible modeling platform that allows rapid simulations for cancer, developmental biology, evolution, immune system, tissue engineering, toxicology, non-cellular soft material and viruses such as Covid-19.

MNT Education Special Interest Group (MNT^eSIG Live) 2020 Virtual Conference Via Zoom, July 27-28, 2020

Online Visualization and Simulation Tools for Teaching Nanotechnology

Order of Presentation

- **Motivation and Targeted Students**
- **Visualization & Simulation at the Nanoscale: Need, Methods of Visualizations, & Benefits**
- **Online Tools for Visualization and Simulations**
 - RAIN
 - NanoHub
 - CompuCell3D
- **Examples of Visualization in RAIN for user samples and visualization of Viruses**
- **AFM Overview: Video**
- **Examples of simulations using nanoHub**
- **Examples of simulations using CompuCell3D: Simulations of COVID-19**
- **Conclusion**

Visualization and Simulation at the Nanoscale

MOTIVATION

- Enhance students understanding of the properties of matter at the nanoscale which differ from bulk material.
- Help instructors improve teaching of abstract concepts of nanoscale phenomena.
- Demand of Global Marketplace: It is predicted that the general need for measurement tools for the emerging field of nanotechnology applications is expected to create a multibillion-dollar market within the next decade.
- Increase knowledge in the field of nanotechnology and STEM education.
- Keeping curricula and labs current with the rapid change of technology pose another challenge for academia.
- Understand the benefits and applications of visualization and simulation at the nanoscale.

Online Visualization and Simulation Tools for Enhancing Students Learning of Nanotechnology

Targeted Students

- 4-year Degree programs in engineering , science and engineering technology
- 2-year Associate Degree in engineering, science and engineering technology
- K-12

Suggested Courses

- Introduction to Nanotechnology
- Introduction to Semiconductor Manufacturing
- Material Science
- STEM courses
- Undergraduate/Graduate research and Independent study
- Micro electromechanical systems (MEMS)
- Physics, Chemistry, Engineering, Molecular Biology, Microbiology & and specialized research about Morphologic characterization of Viruses such as Corvid-19

Need for Visualization at the Nanoscale

- Visualization of physical phenomena can confirm hypothesis.
- Observation provides opportunities for study without damaging the sample.
- Students are motivated by “seeing for themselves”!

A 3-D super-resolution reconstruction of dendrites in primary visual cortex.

Need for Visualization at the Nanoscale

- Morphologic characterization of Viruses such as Corvid-19.
- Development of new products requires visualization coupled with interfacial interactions, and measurement at the nanoscale.
- Objects under study may be too small for our hands to handle or manipulate.

[THUNDER Imager 3D Live Cell & 3D Cell Culture - Decode 3D Biology in Real Time*](#)

Methods of Nanoscale Visualization

- **Optical Microscope**

Suffers from diffraction effect on sample surfaces.
Limited resolution at nanoscale.

- **Scanning electron microscope (SEM)**

Require the use of electron beams at high vacuum environment and cannot be used for biological non-conductive samples and samples under liquid.

- **Atomic Force Microscopy (AFM)**

Uses sharp probe scanning over the sample while maintaining a very close spacing to the surface . A tool to measure both topography and force-related material properties at the nanoscale.

Visualization and Simulation at the Nanoscale

Visualization of processes can be achieved by using laboratory instruments, online simulation and remote access instruments.

Online Tool/Methods of Visualizations and Simulation at the Nanoscale:

- Remote Accessible Instruments for Nanotechnology (RAIN)
- NoanoHUB: www.nanohub.org
- CompuCell 3D
<https://compucell3d.org>

Benefits

- Saving on buying an expensive equipment
- Helps to train students before buying the equipment
- Introduce students to the field of nanotechnology

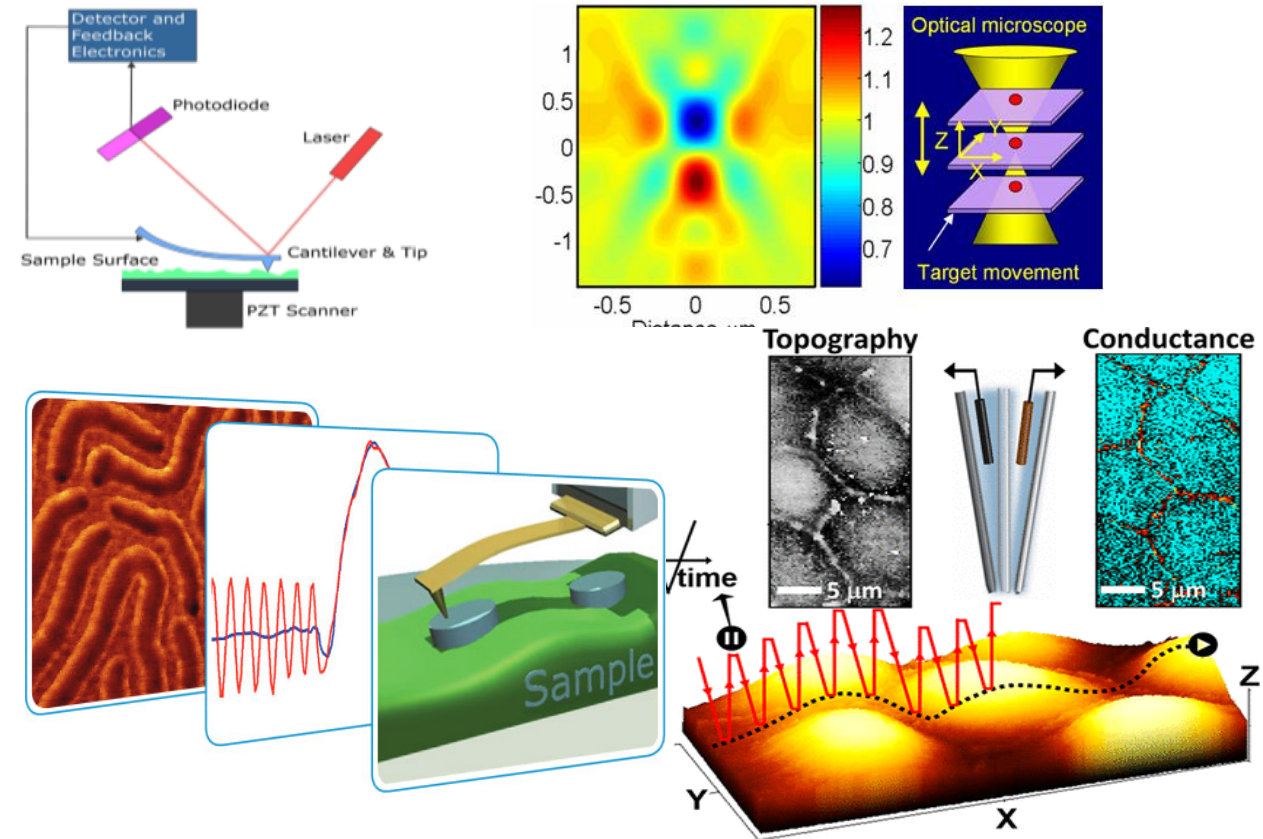

Learning through Visualization at the Nanoscale

Types of Tools at RAIN

RAIN allows students to access and control microscopes and analytical tools, to look at nanosized materials from the ease of classrooms, or home computers, across the country.

Students control the tools over the Internet from 26 centers in real-time.

- Atomic Force Microscope (AFM)
- Optical Microscope
- Confocal Microscope
- Scanning Electron Microscope (SEM)
- Energy Dispersive Spectroscopy (EDS)
- Profilometer
- Ultraviolet–visible Spectrophotometer
- Molecular Analyzer
- Fourier Transform Infrared Spectroscopy (FTIR)
- X-ray fluorescence (XRF)
- Fabrication Tools

Learning through Simulation at the Nanoscale

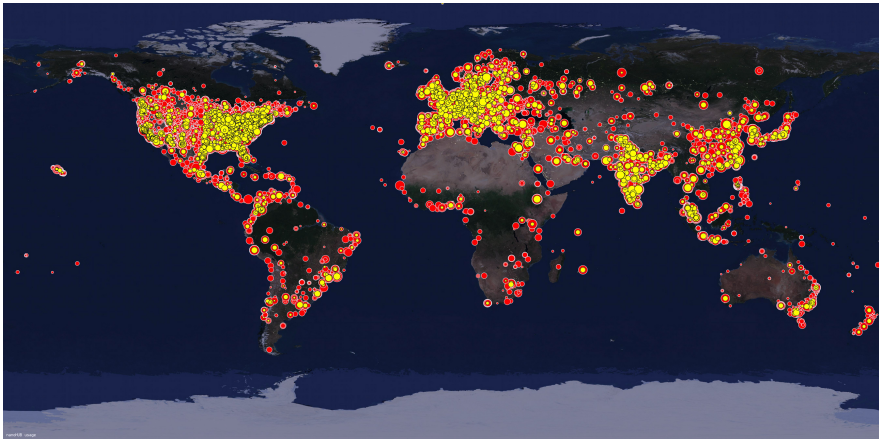

Crystal Viewer Tool
Nanohub.org

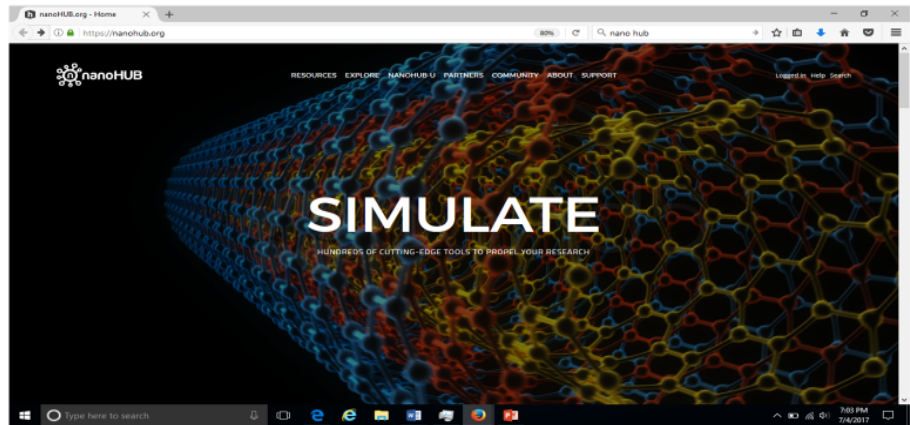

Simulation offers several additional advantages:

- 1. Allowing the user to modify system parameters and observe the outcomes without any harmful side effects**
- 2. Eliminating component or equipment faults that affect outcomes**
- 3. Supporting users progress at their own pace in discovery and understanding of concepts and issues**
- 4. Enhancing the presentation of “dry” concepts by integrating theory and practice**

Simulation Tools at the Nanoscale NanoHub.org

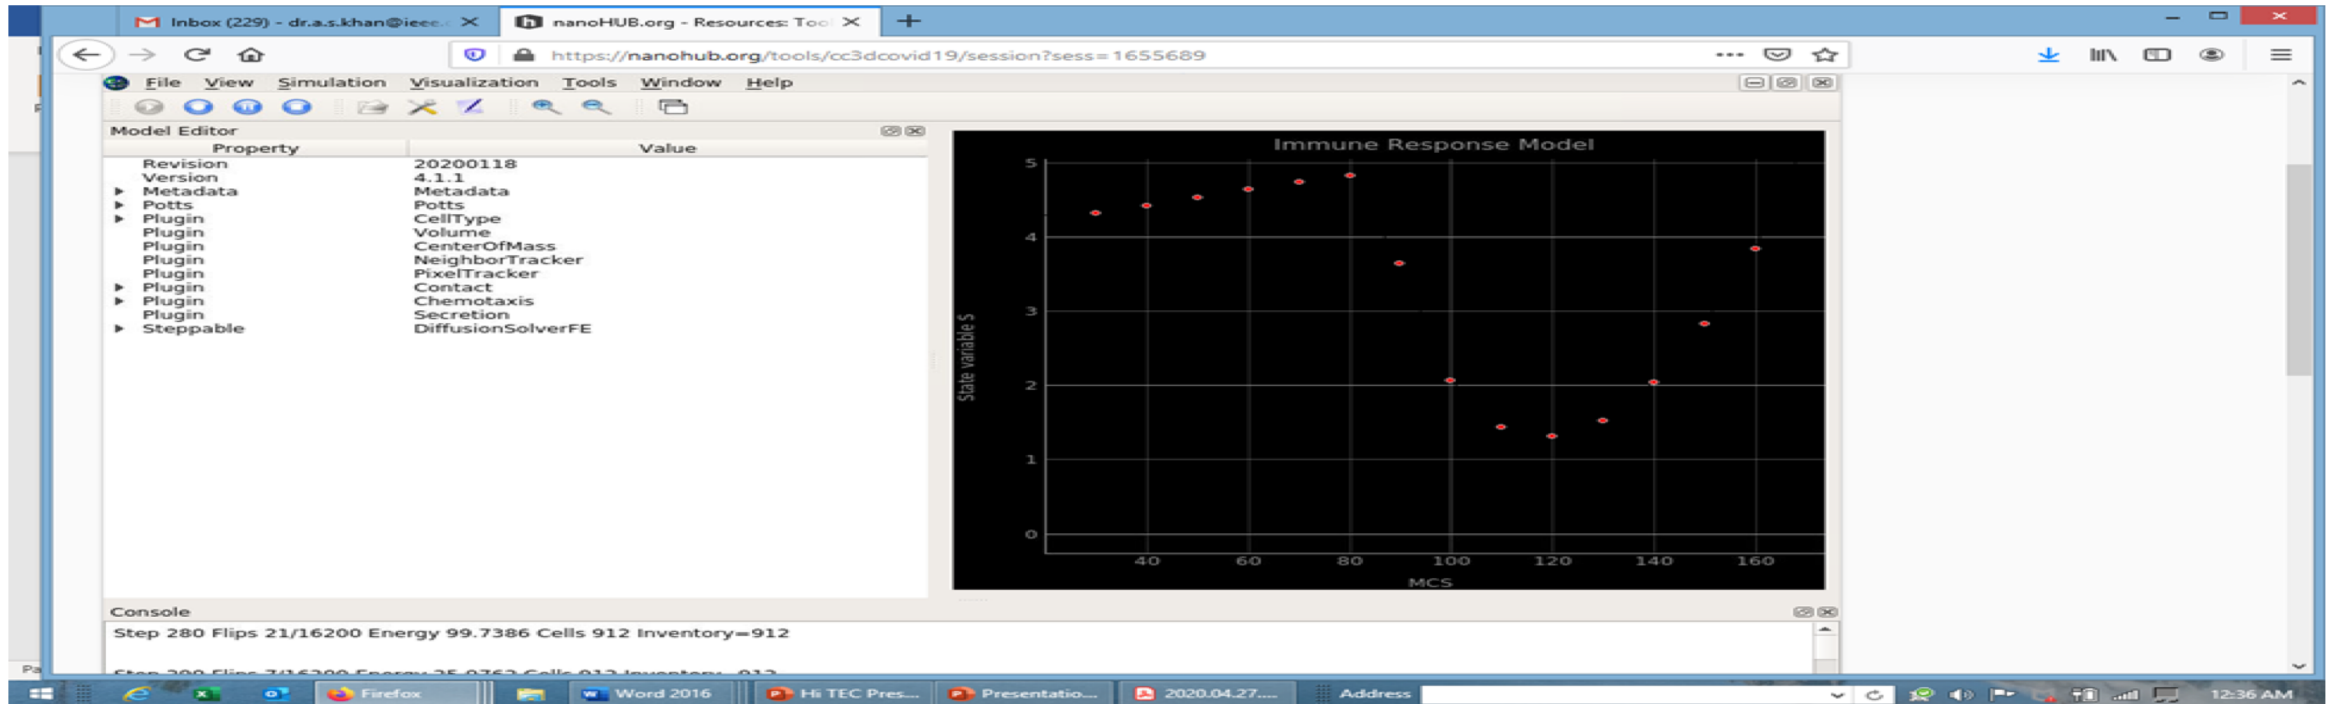

Crystal Viewer Tool
[Nanohub.org](https://nanohub.org)

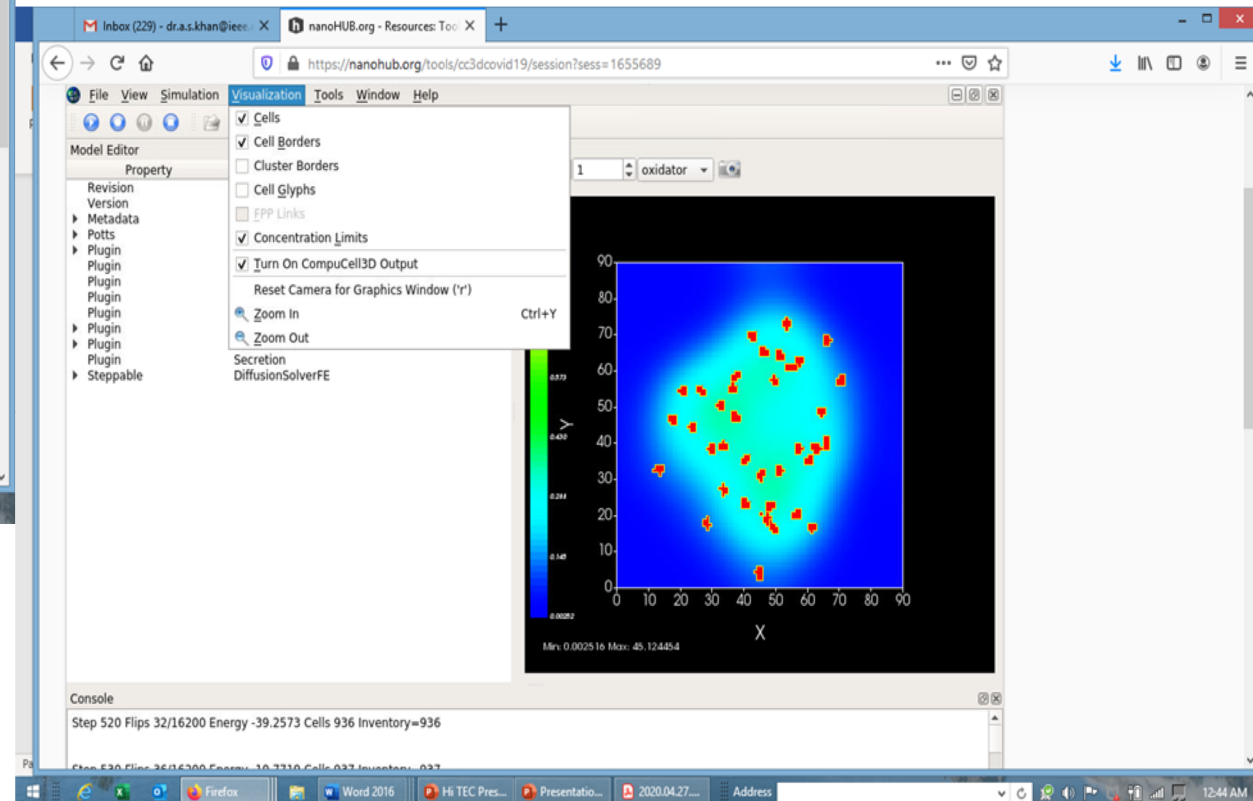

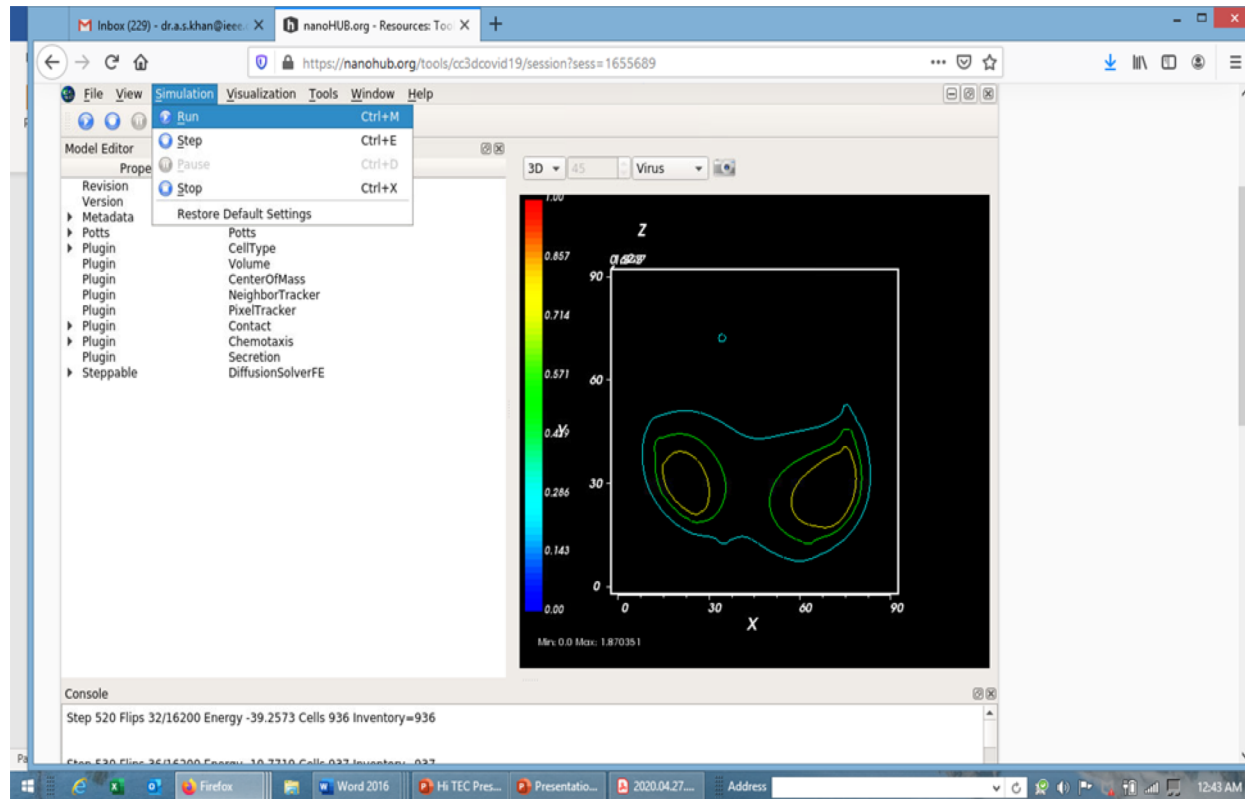

- Computing Cloud located at Purdue University
- 500+ simulation tools
- 1.4 million users Worldwide
- 5500 resources
- The COVID-19 simulation can also be run online without requiring any installations or downloads on the nanoHUB

CompuCell3D

CompuCell3D is a flexible scriptable modeling environment, which allows the rapid construction of sharable Virtual Tissue in-silico simulations of a wide variety of multi-scale, multi-cellular problems including angiogenesis, bacterial colonies, cancer, developmental biology, evolution, the immune system, tissue engineering, toxicology and even non-cellular soft materials. CompuCell3D models have been used to solve basic biological problems, to develop medical therapies, to assess modes of action of toxicants and to design engineered tissues. CompuCell3D intuitive and make Virtual Tissue modeling accessible to users without extensive software development or programming experience. It uses Cellular Potts Model to model cell behavior.

CompuCell3D

CompuCell3D Multiscale, Virtual-Tissue Spatio-Temporal Modeling of Simulations of COVID-19 Infection, Viral Spread and Immune Response and Treatment Regimes

“Simulations of tissue-specific effects of primary acute viral infections like COVID-19 are essential for understanding differences in disease outcomes and optimizing therapeutic interventions. In this two-part mini-workshop we present an open-source Python and CC3DML-scripted multiscale model and simulation of an epithelial tissue infected by a virus, a simplified cellular immune response and viral and immune-induced tissue damage and show how you can use it to model basic patterns of infection dynamics and antiviral treatment. Part I presents the model and teaches how to run it and to change model parameters for generating new biologically meaningful simulations. Part II teaches how to extend the model with additional images, graphics and file outputs, additional cell types, diffusive fields, cell behaviors and interactions and improved subcellular and immune-system models.” [<https://compucell3d.org/>]

How to Run, Extend, Adapt and Improve the CompuCell3D COVID-19 Model

Advantages of AFM Visualization for Biological Structures

- Visualize the structure of viruses at high resolution ranging from a nanometer to hundred microns
- Non-destructive and non-intrusive
- Visualization of virus samples can be carried on the surface of cells in situ, in fluids and air, or post histological procedures
- Does not disturb the specimen from its natural state
- Can be used to identify and study membranes, RNA and DNA, and protein assemblies and their structures
- Relatively inexpensive and portable
- Requires minimal quantity of samples for measurements
- Can be linked with other molecular techniques such as EM or PCR (*Polymerase chain reaction*)

Detection of Viruses using Nanoscale Visualization

Most single virus particles measure about 20 to 250 nm in diameter with some measuring up to 1000 nm. Key techniques widely used for the visualizations are:

- **Electron Microscopy**
- **X-Ray Diffraction Analysis**

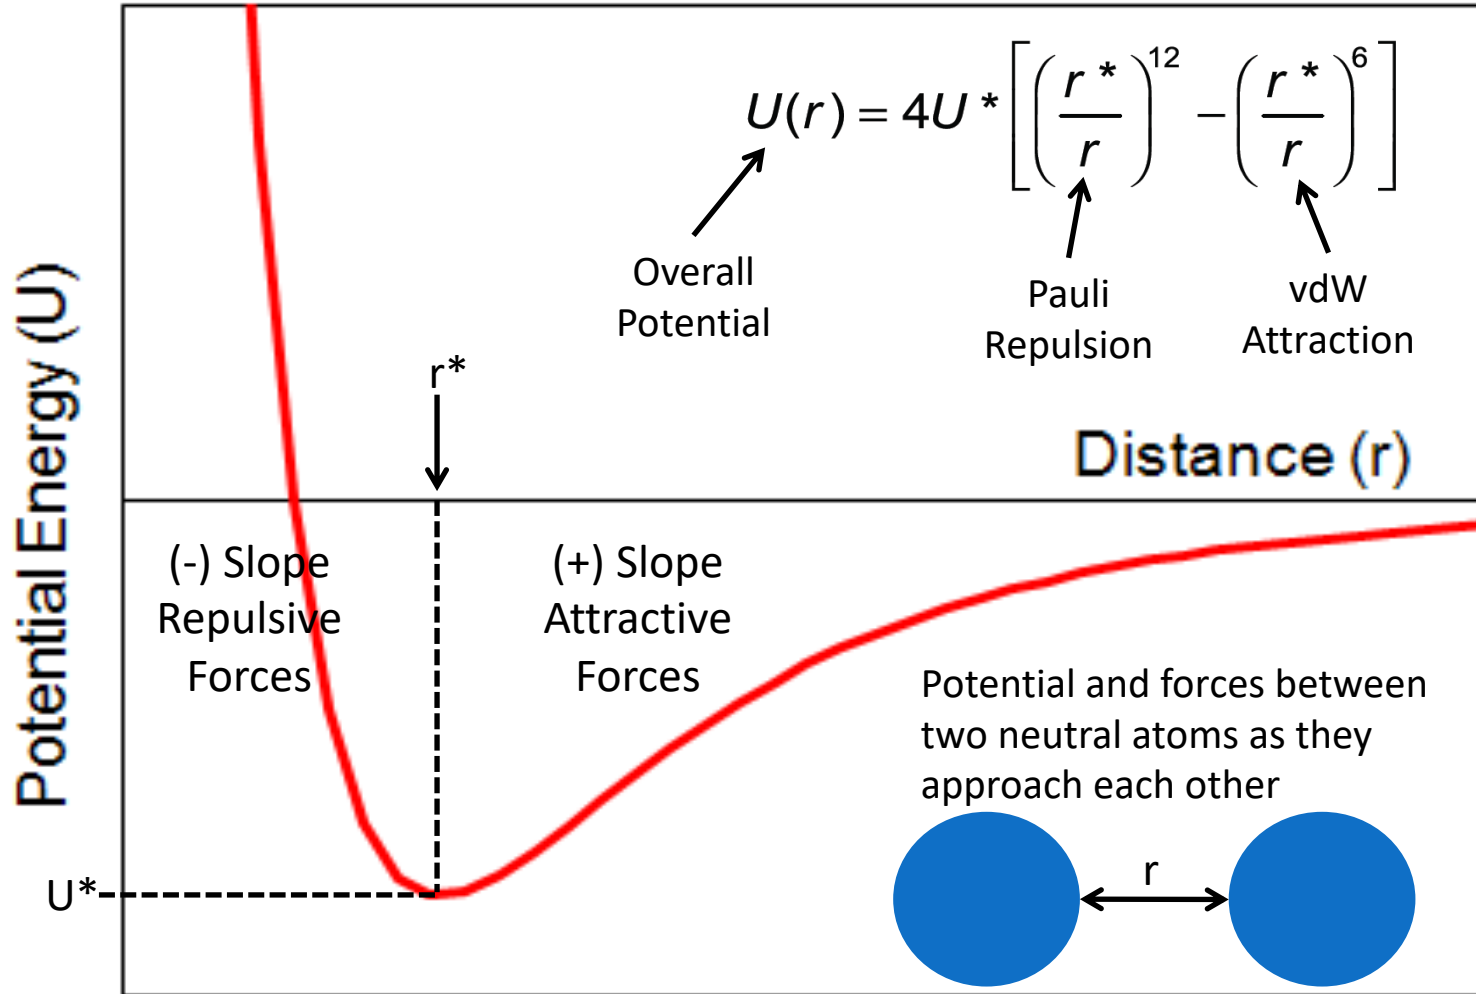

These techniques require expensive equipment, difficult to install and cannot be used for live biological samples as compared to Atomic Force Microscopes which is inexpensive, easy to install, smaller in size with additional features.

AFM Overview: Video

Please place the cursor in the center then click on play button.

Application of Atomic Force Microscopy (AFM) in Imaging of Viruses and Virus-Infected Cells*

- **AFM is nonintrusive and nondestructive; can be applied to soft biological samples, particularly in cases when tapping mode is employed.**
- **Samples can be imaged in air or in fluids (including culture medium or buffer), in situ on cell surfaces, or after histological procedures.**
- **In principle, only a single cell or virion need be imaged to learn of its structure, though normally images of as many as is practical are collected.**
- **AFM produces 3D, topological images that accurately illustrate the surface traits of the virus or cell under study.**
- **The AFM images are like common light photographic images.**
- **The structural shapes of viruses observed by AFM are in harmony with models derived by X-ray crystallography and cryo-EM.**

Opportunities and Challenges for Biosensors and Nanoscale Analytical Tools for Pandemics: COVID-19*

Nanosphere Optics Lab over NanoHub

Calculate absorption from metallic nanoparticles

The screenshot shows the NanoHub interface for the Nanosphere Optics Lab. At the top, there is a navigation bar with the NanoHub logo and links for Resources, Explore, NanoHub-U, Partners, Community, About, Support, and Donate. The main simulation area is titled "Nanosphere Optics Lab" and contains a "Simulate" button and a "new input parameters" button. Below these buttons, there is a description of the tool: "This module calculates the absorption, scattering, and extinction spectra of spherical nanoparticles using Mie theory. Results are given in terms of efficiency factors relative to the expected result from geometric optics. The choice of material (e.g. Gold) determines the wavelength dependent dielectric properties of the spheres. The particle size and refractive index of the material in which the spheres are embedded can be varied. The numerical solution of the scattering problem is achieved using the code of Bohren and Huffman as found in C. F. Bohren, D. R. Huffman, 'Absorption and Scattering of Light by Small Particles' John Wiley and Sons, Inc. (1983). The optical constants of gold and silver are from P. B. Johnson and R. W. Christy, Phys. Rev. B, vol. 6, p. 4370 (1972)." Below the description, there is a small image of gold nanoparticles with a caption: "Solutions of gold nanoparticles ranging from 10 nm (left) to 80 nm (right). Courtesy of Matthew Hammond: JPEG image data, JFIF standard 1.01 3.8 kB". The input fields are: Particle Composition: Au-Gold, Particle Refractive Index: 1.400, Surrounding Medium Refractive Index: 1.000, Radius of particle: 20nm, Beginning wavelength: 300nm, and Ending wavelength: 1000nm. At the bottom, there is a storage indicator showing 23% of 10GB used and a refresh button.

Nanosphere Optics Lab over NanoHub

Calculate absorption and scattering from single nanowires with or without shells

The screenshot shows a web browser window with the URL <https://nanohub.org/tools/nwabsorption/session?sess=1655840>. The page title is "Optical Properties of Single Coaxial Nanowires". The interface includes a navigation bar with "RESOURCES", "EXPLORE", "NANO HUB-U", "PARTNERS", "COMMUNITY", "ABOUT", "SUPPORT", and "DONATE". The main content area is divided into "Simulation Parameters" and "Nanowire Parameters". A "Simulate" button is present, along with "Terminate" and "Keep for later" options. The simulation parameters are set to "Option 1) Total Scattering, Absorption and Extinction", with a wavelength range from 300 nm to 1000 nm, an angle of incidence of 0 degrees, and 20 multipoles. A diagram illustrates the nanowire schematic and the incident light polarizations: Transverse Magnetic (TM) and Transverse Electric (TE). The TM case shows the magnetic field vector \vec{H} perpendicular to the nanowire axis, while the TE case shows the electric field vector \vec{E} perpendicular to the axis. The diagram also shows the wave vector \vec{k} and the angle of incidence α . The interface also displays a "Storage (manage)" bar at the bottom, indicating 23% of 10GB used, and a "1360 x 768" resolution indicator.

Optical Properties of Single Coaxial Nanowires

Simulation Parameters | Nanowire Parameters |

Simulate new input parameters

Optical Properties of Single Coaxial Nanowires

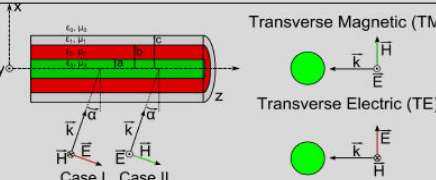

This program computes the following optical properties of a single nanowire with up to 2 shell layers using Mie-formalism:

- 1) Total scattering, absorption and extinction efficiency
- 2) Absorption efficiency of individual layers
- 3) The integrated photon flux absorbed and the ideal photocurrent density under AM 1.5 G illumination as a function of layer thickness
- 4) Electric and magnetic polarizability under TE polarization (E field perpendicular to nanowire axis)

Assumptions:

- 1) Nanowires are infinitely long which is valid as long as the nanowire length is $> 10 \times$ diameter.
- 2) Incident light is a plane-wave whose angle of incidence can be defined. Two polarizations are considered: Case I (H field is perpendicular to the nanowire axis) and Case II (E field is perpendicular to the nanowire axis). Unpolarized response is calculated as an average of Case I and Case II.

Note: When the illumination is incident normal to the nanowire axis, Case I corresponds to transverse magnetic (TM) and Case II corresponds to transverse electric (TE)

Nanowire Schematic:  Transverse Magnetic (TM) Transverse Electric (TE)

Type of Calculation: Option 1) Total Scattering, Absorption and Extinction

Wavelength Range

Initial Wavelength (nm): 300

Final Wavelength (nm): 1000

Angle of Incidence (degrees): 0

characterization tools.**

Conclusion

- Online visualization and simulation tools helps to enhance teaching/learning of nanoscale phenomena in Physics, Chemistry, Engineering, Engineering Technology, Molecular Biology, and Microbiology.
- Online learning supports STEM and Nanotechnology workforce development.
- RAIN provides free online remote access to real world Nanotechnology tools from the ease of classrooms, or home computers, across the country.
- RAIN visualization tools can be used to detect viruses.
- AFM is an inexpensive and portable promising tool for detecting viruses.
- NanoHub is an excellent simulation platform for introducing and analyzing nanotechnology phenomena at all educational levels at no cost.
- NanoHub's CompuCell3D simulation tool allows online simulation of COVID-19 without requiring any installations or downloads.
- CompuCell3D is a flexible scriptable modeling environment, which allows the rapid simulations for cancer, viruses, developmental biology, evolution, the immune system, tissue engineering, toxicology, and non-cellular soft materials.
